

Algorithm Design Strategy Prune and Search AKA Decrease and Conquer Examples: binary search quick select (randomized prune and search) Randomized Algorithms (later) Quick Sort and Quick Select

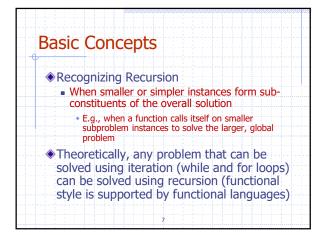

Binary Search (§ 3.1.1) Binary search performs operation findElement(k) on a dictionary implemented by means of an array-based sequence, sorted by key similar to the high-low game at each step, the number of candidate items is halved terminates after O(log n) steps Example: findElement(7) -(5)-7 8 9

Binary Search Algorithm (iterative) Algorithm BinarySearch(S, k): Input: A sorted array S storing n items Output: An element of S with value k. $low \leftarrow 0$ $high \leftarrow S.length - 1$ while low < high do $mid \leftarrow (low + high)/2$ if k = S[mid] then return S[mid] else if k < S[mid] then $\mathsf{high} \leftarrow \mathsf{mid} - 1$ $\mathsf{low} \leftarrow \mathsf{mid} + 1$ return NO_SUCH_KEY

3 4

Binary Search Algorithm (one key comparison per iteration) Algorithm BinarySearch(S, k): Input: A sorted array S storing n items Output: An element of S with value k. $\text{high} \leftarrow \text{S.size()} \text{-} 1$ $mid \leftarrow 0$ while low < high do $mid \leftarrow (low + high)/2$ if k < S[mid] then $\mathsf{high} \gets \mathsf{mid}\text{-}1$ else $\mathsf{low} \leftarrow \mathsf{mid}$ if S.size() > 0 / k = S[mid] then return S[mid] else return NO_SUCH_KEY

Types of Recursion

*Linear recursion

*Tail recursion

*Multiple recursion

*Mutual recursion

*Nested recursion

7

Types of Recursion

Linear recursion

When a method calls itself only once in the body of the function

Algorithm sumFirst(n)

if n < 0 then Throw InvalidInputException

if n = 0 then

return 0

else

return n + sumFirst(n-1)

Types of Recursion

* Tail recursion

A special case of linear recursion in which a method calls itself only once but the call occurs as the last operation executed in the body of the method

Functional languages optimize tail recursive functions since there is no need to create a new stack frame (activation record)

Algorithm sumFirst(n)

if n < 0 then Throw InvalidInputException return sumFirstHelper(n, 0)

Algorithm sumFirstHelper(n, s)

if n = 0 then return s else

return sumFirstHelper(n-1, n+s)

9 10

Types of Recursion

Multiple recursion

When a function calls itself two or more times
Example is MergeSort and QuickSort (next week)
Functions that traverse a binary tree (later today)

Must be careful because multiple recursion algorithms can quickly explode to O(2n)

Algorithm Fib(n)
if n = 0 then
return 0
else if n = 1 then
return 1
else
return Fib(n-2) + Fib(n-1)

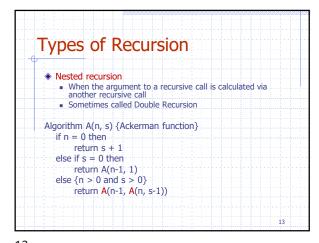

Types of Recursion

• Mutual recursion
• When a group of methods repeatedly call each other until a base case is reached

Algorithm isEven(n)
if n = 0 then
return true
else
return isOdd(n-1)

Algorithm isOdd(n)
if n = 0 then
return false
else
return isEven(n-1)

11 12

Recursive Thinking

Think declaratively

1. Define the base cases

Instance(s) that can be calculated without using recursive calls

2. Decompose the problem into simpler or smaller instances of the original problem

A smaller/simpler instance must be moving toward one of the base cases (so the function terminates)

Create an induction diagram to determine what to do in addition to the recursive calls

13

Recursive Thinking
(AKA Subgoal Induction)

Input Parameters Final Solution

Smaller Input Parms. Smaller Solutions

Exercises

- Write a pseudo code function, isEven(n) to recursively determine whether a natural number, n, is an even number.
- Write a pseudo code function, sum(n), to recursively calculate the sum of the first n natural numbers.
- Write a pseudo code function, sum2(n), to recursively sum the first n natural numbers but divide the problem in half and make two recursive calls.
- 4. Write a pseudo code function, power(x, k), that computes x^k. Can you do this in log k time?

15

16

14

Exercise on List

Generic methods:
 integer size()
 boolean isEmpty()
 objectificator elements()
Accessor methods:
 position last()
 position last()
 position last()
 position elements()
 position before(p)
 position after(p)
 Query methods:
 boolean isFirst(p)
 boolean isIsst(p)
 Update methods:
 swapElements(p, q)
 replaceElement(p, q)
 insertIsst(o)
 insertBefore(p, o)
 insertBefore(p, o)
 insertAfter(p, o)
 remove(p)

Trees

Exercise:
 Write a recursive method to calculate the sum of the integers in a list of integers

Algorithm sum(L)

Algorithm sum(L)

Algorithm sum(L)

Algorithm sumHelper(L, p)

Trees

Binary Search Algorithm

(recursive)

Algorithm BinarySearch(*S, k, low, high*):

Input: A sorted array S storing n items
Output: An element of S with value k between indices low & high.

if low > high then
return NO_SUCH_KEY
else
mid \(\(\text{(low + high)} \)/2
if k = S[mid] then
return S[mid]
else if k < S[mid] then
return BinarySearch(S, k, low, mid-1)
else
return BinarySearch(S, k, mid + 1, high)

Main Point

1. Any iterative algorithm can be computed using recursion, i.e., a function calling itself. In fact, the meaning of while- and for-loops are defined using recursive functions in programming language semantics (Denotational Semantics). Recursive algorithms keep reducing the size of the inputs instances until a base case is reached, then the solution is computed from the base case up to the solution for the whole problem.

Science of Consciousness. Maharishi describes the process of creation as a self-referral process that unfolds sequentially. The dynamism of the unified field seems chaotic when studied at the macroscopic level, yet it is a field of perfect order, responsible for the order and balance in creation.

Connecting the Parts of Knowledge With the Wholeness of Knowledge Recursion

- 1. A recursive algorithm calls itself repeatedly until it reaches the base case, then the results of these calls are combined to compute the final result.
- 2. There are different categories of recursive algorithms depending on how many and where the recursive calls occur, i.e., linear, tail, multiple, mutual, and nested (double) recursion.
- 3. *Transcendental Consciousness* is the self-referral field of *infinite correlation*, from which all of creation emerges, where "an impulse anywhere is an impulse
- 4. *Impulses within the Transcendental field.* The dynamic natural laws reside in this field, where the self-referral laws of nature govern all of creation.
- 5. Wholeness moving within itself. In Unity Consciousness, the field of action effortlessly unfolds as the play of one's own Self, one's own pure consciousness.
